

Logistics for hospital waste

Die 3E Logistic AG can look back on a long-term experience in the disposal of hospital waste.

The transports, by which the waste is transported in specially secured and sealed boxes, present high demands not only to the consignor and the recipient, but also specifically to the drivers.

The clinical waste is picked up directly at hospitals or from specially constructed storage facilities. Packaging manufactured especially to deal with this waste prevents the leakage of contaminated, infectious or non-sterile materials.

The load is stowed in the truck according to a specifically compiled stowage plan and secured throughout the transport.

The products are moved in refrigerated containers as a rule. The unloading at the destination, usually hazardous waste incineration plants, is undertaken taking all potential safety hazards into account.

The procedure and the coordination of these transports present the highest demands to both the persons and the technology as for example defects or leakage from a container could entail considerable hygienic problems.

Should such an incident arise, 3E Logistic AG has the necessary means and relationships to alleviate such damage as quickly as possible.
